

Singlepoint Program Manager is the simple and effective way to connect team members to Programs and Projects, assemble key tasks, deadlines and data and see risk before it's too late.

When a Program is managed manually in spreadsheets or on a desktop database, as a team member it's very hard to know what the other team members have done, when and what is expected of you next, where all the project documents are and to have an accurate sense of how the project is going. If you happen to be a manager of a Program then getting current status normally means calling a meeting. There is a better way.

Singlepoint Program Manager controls the process, manages the documents and the tasks, provides the action list, the dashboard, the reminders, the notifications (and even escalation if necessary) – it sees the risk before it hurts you and enables you to work effectively as a team. Fully integrated into Singlepoint for handling Documents, Issues, Change and Management Reporting and all with a UI in any language your user needs.

One Common Program Workspace For Your Team

Configurable to your preferred Program / Project structures.

One single, real-time workspace for all Program / Project team members.

All Program / Project documents stored centrally in the Singlepoint DCS but available to all team members from the workspace.

Tasks have ownership, visibility and risk status (green, yellow, red).

"Tasks" can mean submit a document, hold a meeting, carry out an audit or inspection, sign-offs – i.e. pretty much anything can be a task.

Timing chart with dependencies and risk status.

Fully integrated into Singlepoint including Document Control, Issue Manager, Change Manager, Absolute Reporting and APQP Manager.
